Instructional Bulletin #8.34 Revised: May 2011

Introduction

Screen printing is one of the most complex means of image reproduction due to the many variables in substrate, ink chemistries, and application techniques. Continual adjustments are frequently required to consistently produce high quality prints. This troubleshooting guide is designed to assist in these adjustments, as well as identify causes of typical printing and computer sign cutting problems. The guide is divided into four categories: Stencil Problems, Printing Problems, Sign Cutting Problems, and Application Problems.

Problem	Cause	Solution
Difficult to develop stencil	Poor quality or low density	Re-shoot positive to give proper density.
or washout stencil	film positive	Use a photopolymer emulsion.
	Drying temperature too high	Reduce temperature in drying cabinet.
		Maintain 80°-90°F ambient temperature and
		40%-50% RH or lower.
	Overexposure	Use Exposure Calculator to determine proper
		exposure.
	Screen fogged before	Use safelights wherever there are unexposed
	exposure (i.e. premature	screens.
	exposure)	Use a Safelight Tester to ensure adequate safelight
		conditions.
 Emulsion filling in printed 	Light Geometry	Set proper distance from exposure source to vacuum
areas (loss of print detail)		glass (usually equal to diagonal of frame).
		Multiple light sources (e.g. fluorescent tubes) can
		cause undercutting and light scatter.
	Overexposure	Use Exposure Calculator to determine proper
		exposure.
	White mesh	Use dyed mesh to reduce light scatter.
	Drying temperature too high	Reduce temperature in drying cabinet.
		Maintain 80°-90°F ambient temperature and
		40%-50% RH or lower.

1-800-282-8379

Instructional Bulletin #8.34 Revised: May 2011

Problem	Cause	Solution
• Pinholes	 Insufficient drying and/or 	Add a Dehumidifier.
	excessive humidity	Maintain 80°-90°F ambient temperature and
		40%-50% RH or lower.
		• Improve airflow to increase drying speed.
		Seal the walls with a sealant or oil-based paint to
		prevent water migration into the screen drying room.
		(Dry wall is NOT a good moisture barrier.)
	• Insufficient Mesh	Degrease mesh thoroughly with recommended
	Preparation	degreaser.
		Do not touch degreased mesh.
		• If you use direct emulsions exclusively, abrading the
		mesh is generally not necessary.
		• If capillary films are used, abrade films with abrasion
		solution.
	 Dust and Dirt 	Remove fans from the screen drying room.
		Seal walls, floor and ceiling.
		Clean vacuum glass and film positives.
		Some screen departments may require an air
		filtration unit (small HEPA type).
	 Underexposure 	Use Exposure Calculator to determine proper
		exposure.
	 Improper Handling 	Slow down emulsion coating stroke. Coating too
		quickly causes air entrapment in mesh openings.
		Allow emulsion to de-gas after mixing in the diazo
		sensitizer.
		Keep lid on emulsion container when not in use.

Instructional Bulletin #8.34 Revised: May 2011

Problem	Cause	Solution
Stencil Sawtooth (i.e.	Stencil too thin or too rough	Increase coating strokes from the squeegee side of
jagged edges on stencil		the screen.
causing poor print definition)		Use the round coater edge rather than the thin sharp
		edge.
		Use an emulsion with higher solids content.
		Dry the coated screen with the squeegee side up and
		the print side down.
		Control coating method with Electronic Thickness
		Gauge.
		Face coat the print side if necessary.
	Underexposure (Note:	Use Exposure Calculator to determine optimum
	Extreme overexposure can	exposure.
	also cause this	
	phenomenon.)	
	Mesh count too coarse	Re-expose image on finer mesh count.
	Insufficient vacuum	Inspect blanket and tubing for leaks.
	pressure	Service vacuum pump.
		Ensure that screen frames are flat, then increase
		vacuum pressure.
	Halation or Light Scatter	Use dyed mesh rather than white mesh.
Difficulty in reclaiming	Underexposure	Use Exposure Calculator to determine optimum
screen		exposure.
	Solvent attack	Photopolymer stencils and underexposed stencils are
		more susceptible to lock-in from hot, fast-flashing solvents
		found in screen washes.
		Use safety solvents for removing inks.
	Incorrect reclaiming	Use the proper Screen Stripper chemicals (not laundry)
	chemicals	bleach) for removing photopolymer emulsions.
		Use the proper chemicals for removing inks stains
		and diazo stains.

Instructional Bulletin #8.34 Revised: May 2011

Problem	Cause	Solution
 Inks are drying in the 	Time delay between each	Always use a flood pass between prints to keep the
screen	print	screen wet.
	Ink is too thick	Avoid extended breaks between prints.
	Shop temperature is too	Remix the ink using more thinner.
	warm	Screen print in an environmentally controlled area.
	Too much airflow on	Keep all fans from blowing directly on the screens.
	printing surface	
 Straight streaks in the 	 Nicked squeegee 	Sharpen or replace squeegee blade.
direction of the squeegee	 Ink trailing behind 	Clean ink from the squeegee. If hand screening, use
pass	squeegee	the same side of the squeegee for the fill pass. Take
	Backing split on pressure	care to prevent ink from getting into the backside of the
	sensitive stock	squeegee.
	Scratch or joint in the table	Use un-split stock and split after printing, if desired.
		Refinish or replace tabletop.
 Clear coat is clouding up 	High humidity in shop area	Screen print in an environmentally controlled area.
	Not using enough thinner	Thin down clear coat up to 10% by volume.
 Sheeted faces not laying 	Set curl in roll	Stack faces overnight under slight pressure/weight.
flat during screening		Order reverse wound rolls of sheeting.
		Place in vacuum applicator for 30 seconds.
 Streaks parallel to the 	Uneven squeegee pressure	Keep squeegee pressure even and constant.
squeegee	during the pass	Keep squeegee speed constant.
	Hesitation during the	Keep squeegee angle constant.
	squeegee pass	Use unsplit stock and split after printing, if desired.
	Variation of squeegee angle	Refinish or replace tabletop.
	during screening pass	
	Backing split on pressure	
	sensitive stock	
	Scratch or joint on table	
 Blotches or curved marks 	 Ink drying in the screen 	Clean the blocked screen areas & make several
in the print	Too little off-contact	waste passes onto paper before resuming the run.
	 Ink too thick, causing poor 	Increase off-contact.
	screen break behind the	Re-mix ink adding slightly more thinner, or add fresh
	squeegee	ink if the ink has thickened on the press.

Instructional Bulletin #8.34 Revised: May 2011

Problem	Cause	Solution
 Inks are cobwebbing 	• Ink is too thick	Thin ink as needed.
	Static electricity is present	Ground the printing table using a tensile rope.
Sheeting is cracking during or immediately after printing	Insufficient airflow Material applied with too much tension	 Signs must be dried using high volume fans and effective ventilation. Use proper tension loops during lamination.
• Ink bubbles	 Improper off-contact Squeegee pass is too fast Lack of fill pass Ink is too thin Air bubbles in ink 	 Adjust off-contact so that only the area under the squeegee contacts the printing surface and the screen lifts cleanly behind the squeegee. Slow the squeegee. Use a fill pass before the impression. Add more un-thinned ink. If ink is already being used straight from the can, use a smaller mesh screen. Allow ink to stand 10-15 minutes after mixing to allow air bubbles to escape.
Mottled appearance	 Ink is too thin Ink is not mixed well Improper thinner Improper ink drying in screen Improper off-contact 	 Add more un-thinned ink. If ink is already being used straight from the can, use a smaller mesh screen. Re-mix. Do not whip air into the ink while mixing. Check ink manufacturer for recommendation of alternate thinner. Try adding a small amount of slow thinner or retarder. Clean the blocked screen areas & make several waste passes onto paper before resuming the run. Adjust off-contact so that only the area under the squeegee contacts the printing surface and the screen lifts cleanly behind the squeegee.
"Orange Peel" appearance	Ink too thinInk not well mixedScreen not "breaking"Wrong thinner	 Re-mix with more thinner. Re-mix ink. Increase off-contact properly behind squeegee. Tighten screen fabric if it is not taut. Check ink manufacturer for appropriate thinner recommendations.

Avery Dennison® Troubleshooting Guide

Instructional Bulletin #8.34 Revised: May 2011

Problem	Cause	Solution
Pinhole white spots in print	Ink too thick	Re-mix with more thinner.
	Ink drying in the screen	Clean the screen and make several waste passes
	Non-wetting	onto paper before continuing the run. If necessary,
		use a slower or add retarder.
		Check to be sure the correct thinner is being used &
		that it is well mixed. If contamination is suspected,
		wipe sheets with a clean cloth dampened with toluol,
		xylol or the ink thinner being used. Contamination can
		be from fingerprints, spray lubricants, release agents,
		adhesives, hand creams, or many other sources.

Troubleshooting Sign Cutting Problems

Problem	Solution
Face film is tearing upon cutting.	Replace used blade with new carbide blade.
	 Confirm blade angle or adjust blade angle to 45°.
	Reduce blade pressure / cutting weight.
	Confirm liner type to be 90#.
	Reduce cutting speed.
Blade is "skipping" over film producing perforations on	Replace used blade with new carbide blade.
rough cut of the face film.	 Confirm blade angle or adjust blade angle to 45°.
	Reduce blade pressure / cutting weight.
	Reduce cutting speed.
Blade is cutting into liner.	 Confirm blade angle or adjust blade angle to 45°.
	Reduce blade pressure / cutting weight.
Blade not completely cutting through the film.	Replace used blade with new carbide blade.
	 Confirm blade angle or adjust blade angle to 45°.
	Confirm liner type to be 90#.
	Increase blade pressure / cutting weight.

Instructional Bulletin #8.34 Revised: May 2011

Application Problems

Problem	Cause	Solution
Poor Adhesion	Contaminated substrate	Wipe with solvent or a tack cloth to remove dirt or
		contaminant. Check the cleanliness of the substrate
		using the tape or water test.
	 Unapproved Substrates 	Some materials are not compatible. Check IB # 8.01
		for suitability.
Air Bubbles	 Nicks or cuts in the nip 	Resurface or replace the nip rollers.
	rollers	
	Surface of the substrate is	Sand or finish the substrate following the instructions
	to rough or is contaminated	in IB # 8.01.
 Panel is not staying 	• Edge guide, stock roll,	Align the stock and the liner roll so they are centered
aligned with the sheeting	and/or liner roll is not	on the applicator. Then align all edge guides.
	centered	
	 Incorrect roller pressure or 	Check pressure and alignment and adjust as
	rollers mis-aligned	necessary.
	 Roll is telescoped 	Remove the stock roll stand on edge and rewind until
		it is aligned.
	 Panels are not cut square 	Check the panels using a Professional square.
	 Warped or bowed rollers 	Resurface or replace the nip rollers.
 Sheeting wrinkles 	Roll is telescoped	Remove the roll, stand on end and rewind until it is
		aligned.
	Mis-aligned or warped	Resurface or replace the nip rollers.
	rollers	
	• Stock roll, and/or liner roll is	Align the stock and the liner roll so they are centered
	not centered	on the applicator.
	Improper tension loop or	Run sheeting with smaller tension loop. Run with the
	stripper roll is in the wrong	striper roll in the up position.
	position	
Sheeting cracks after	Tension is too tight	Run sheeting with tension loop.
application
